INTRODUCTION

In today's world, most businesses are using computer-based systems to manage their daily work. Managing stock, sales, billing, and customer details manually can be difficult and time-consuming. It may also lead to calculation mistakes, data loss, and confusion in maintaining records. In a CCTV business, it is very important to track products, monitor stock levels, and manage both shop sales and online orders properly. To solve these problems, the project "Inventory Management System For Electronic Equipments of Miracle " has been developed.

This project is designed to manage the complete business operations of a CCTV shop in an organized and efficient way. It helps the business owner handle purchasing, stock management, sales records, customer information, and billing in a systematic manner. The system reduces manual work and makes the entire process faster and more accurate.

The project mainly consists of two parts: the Admin Dashboard and the Online User Interface.

The Admin Dashboard is developed using C# WinForms and is used by the shop owner or admin to control all internal activities of the business. Through this dashboard, the admin can add new products, manage stock, record purchases, and enter sales details. The system also keeps track of total sales, online sales, and offline sales separately. This helps the owner understand how much business is happening from the shop and how much from online customers. The billing and invoicing feature makes it easy to generate proper bills for customers. The system also shows high selling products, which helps the owner know which products are in demand. Another important feature is the low stock alert, which notifies the admin when product quantity goes below a certain limit. This helps in maintaining proper inventory and avoiding stock shortages.

The second part of the project is the online website developed using HTML, CSS, JavaScript, and ASP.NET Web API. This website is designed for customers. Through this platform, customers can view different CCTV products, browse categories, add items to their cart, and purchase products online. They can also create their own account and manage their profile information. This online system allows the business to expand beyond physical shop sales and reach more customers through the internet.

The system uses MySQL as the database, where all important data such as product details, stock information, customer records, sales transactions, and online orders are stored securely. Both the Admin Dashboard and

The online website are connected to the same database using ASP.NET Web API. Because of this connection, whenever a product is sold online or offline, the stock is updated automatically. This ensures that the data remains accurate and consistent in the entire system.

The main aim of this project is to develop a combined stock and sales management system that supports both offline and online business operations. It improves efficiency, reduces manual errors, saves time, and provides better control over business activities. By integrating shop management with an online selling platform, this system helps the Miracle CCTV business operate in a more modern and professional way.

EXISTING SYSTEM

Before developing the Inventory Management System For Electronic Equipments of Miracle , the work in the CCTV shop was mostly managed using manual methods and Microsoft Excel sheets. The shop owner maintained product details, stock records, sales information, and customer data in separate Excel files or sometimes in registers.

Whenever new CCTV products such as cameras, DVRs, or other accessories were purchased, the details were entered manually in Excel. In the same way, when a product was sold, the sales entry had to be updated manually. Billing was also prepared manually using simple formats. Because everything depended on manual updates, the process required more time and effort.

Managing large amounts of data in Excel sheets was not always easy. Sometimes it was difficult to find old records quickly. Also, there was no proper connection between stock management and sales records. Due to this, the shop owner had to check and update stock manually after every sale.

Drawbacks of Existing System

- **Manual Work**
  All records such as stock, sales, and customer information are maintained manually in Excel sheets or registers, which takes more time.
- **Chances of Errors**
  While entering data or doing calculations in Excel, mistakes can happen, which may lead to incorrect records.
- **No Automatic Stock Update**
  Stock quantity is not updated automatically after a product is sold, so it has to be changed manually.

- **No Low Stock Notification**

  The owner has to check stock manually to know which products are running out.
- **Difficult Sales Tracking**

  It becomes difficult to track total sales or separate online and offline sales properly.
- **No Online Selling Facility**

  Customers cannot view or purchase products online, so sales are limited only to the physical shop.

Because of these limitations, the existing system was not very efficient for managing business operations. Therefore, there was a need to develop a computerized system that can manage stock, sales, billing, and online orders in a better and more organized way.

Need And Scope of the System

Need of the System

1. **To reduce manual work**

   The existing system uses Excel sheets and manual records, which take a lot of time to manage.
2. **To improve accuracy**

   Manual data entry may cause calculation mistakes or wrong records, so a computerized system is needed.
3. **To manage stock efficiently**

   The system helps the owner track available CCTV products and update stock automatically after sales or purchases.
4. **To maintain proper sales records**

   It helps in storing and managing all sales details in one place.
5. **To generate bills and invoices easily**

   The system allows quick creation of bills, which saves time and reduces errors.
6. **To manage customer information**

   Customer details can be stored safely and accessed whenever needed.
7. **To support online sales**

   Customers can view products, add them to cart, and purchase online through the website.
8. **To get business reports**

   The system helps the owner see total sales, online sales, offline sales, high selling products, and low stock alerts.

Scope of the System

1. **Product Management**

   The system allows the admin to add, update, and manage CCTV products and categories.
2. **Stock Management**

   It keeps track of product quantities and shows alerts when stock becomes low.
3. **Purchase Management**

   The admin can record details of products purchased from suppliers.
4. **Sales Management**

   The system manages both **online sales and offline shop sales**.
5. **Billing and Invoicing**

   Bills and invoices can be generated quickly through the admin dashboard.
6. **Customer Management**

   Customer information and purchase details can be stored and managed easily.
7. **Online Shopping Feature**

   Customers can browse products, add items to cart, view categories, and buy products online.
8. **Business Analysis**

   The system provides reports such as total sales, high selling products, and stock status.
9. **Future Expansion**

   The system can be improved later by adding features like online payment, mobile application, and advanced reports.

PROPOSED SYSTEM

The proposed system is the **Inventory Management System For Electronic Equipments of Miracle** , which is designed to automate and simplify the daily operations of the CCTV business. In this system, the admin can manage product purchasing, stock details, sales records, customer information, and billing through a C# WinForms dashboard. The system also provides an online platform where customers can view CCTV products, browse different categories, add items to their cart, and purchase them online. Both the admin dashboard and the online user interface are connected to a centralized MySQL database, which ensures that stock and sales information is updated automatically. This system helps reduce manual work, improves accuracy, and makes business management faster and more efficient.

Objectives of the System

1. **To automate business operations**
   The system aims to replace manual work and Excel sheets with a computerized system.
2. **To manage product stock efficiently**
   It helps the admin track available products and update stock automatically after sales or purchases.
3. **To maintain accurate sales records**
   The system stores all sales details in the database for easy tracking.
4. **To provide easy billing and invoicing**
   Bills can be generated quickly and accurately through the system.
5. **To manage customer information**
   Customer details can be stored and accessed whenever needed.
6. **To support online product sales**
   Customers can view products and purchase them through the website.

7. **To provide useful business reports**

   The system shows reports like total sales, online sales, offline sales, and high selling products.

8. **To reduce errors and save time**

   Automation helps minimize mistakes and improves work efficiency.

Software Requirement Specification

1. Operating System

- Windows 10 or above

2. Programming Languages

- C# (for Admin Dashboard)
- HTML, CSS, JavaScript, ASP.NET (for User Interface)

3. Framework

- ASP.NET Web API

4. Database

- MySQL (MySQL Workbench)

5. Development Tools

- Visual Studio

6. Web Browser

- Google Chrome / Microsoft Edge

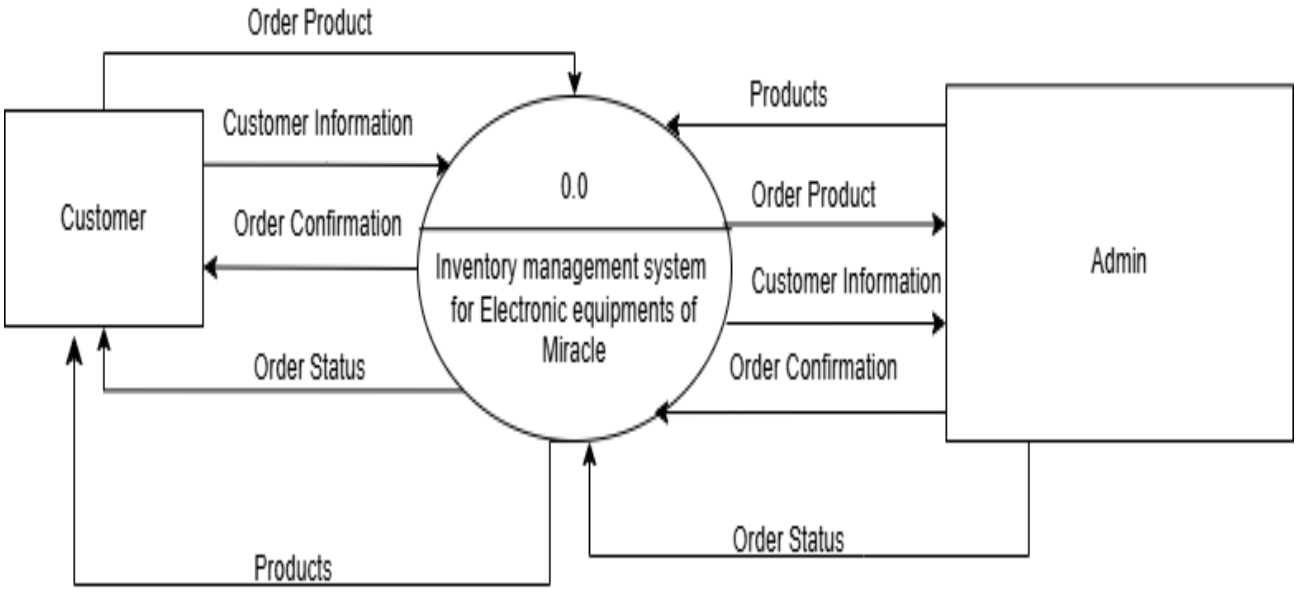

7. Other Requirements

- Basic internet connection for online sales system

CONCLUSION AND SUGGESTION

CONCLUSION

The **Inventory Management System For Electronic Equipments of Miracle** is developed to simplify and improve the management of a CCTV business. The system helps the shop owner manage important business activities such as purchasing, stock management, sales records, customer information, and billing in a more organized way.

Earlier, many of these activities were handled manually or through Excel sheets, which was time-consuming and had chances of errors. With the help of this system, the admin can easily track stock, monitor sales, generate invoices, and manage both online and offline customers from a single platform. The system also provides useful features such as low stock alerts and high selling product reports, which help the owner make better business decisions.

The online user interface also allows customers to view products, browse different categories, add items to the cart, and purchase products online. This helps the business expand beyond the physical shop and reach more customers through the internet.

SUGGESTION

- **Online Payment Integration**

Payment gateways such as UPI, credit card, or debit card can be added for easier online transactions.

- **Mobile Application**

A mobile app version of the system can be developed so that customers and the admin can access the system from smartphones.

- **Notification System**

SMS or email notifications can be added for order confirmation, delivery updates, and low stock alerts.

- **Advanced Sales Reports**

More detailed reports and graphical analysis can help the owner understand business performance better.

- **Security Improvements**

Additional security features such as stronger authentication and data backup can be implemented to protect business data.

FUTURE ENHANCEMENT

- **Online Payment Integration**

Payment options such as UPI, debit card, credit card, and net banking can be added to make online purchasing easier for customers.

- **Mobile Application Development**

A mobile application can be developed so that customers and the admin can access the system through smartphones.

- **SMS and Email Notifications**

The system can send automatic notifications to customers for order confirmation, order status, and delivery updates.

- **Advanced Sales Reports**

Graphical reports and detailed sales analysis can be added to help the owner understand business performance.

- **Product Reviews and Ratings**

Customers can be allowed to give feedback, ratings, and reviews for products on the website.

- **Automatic Data Backup**

A backup system can be added to store data securely and prevent data loss.

- **Delivery Tracking System**

Customers can track the status of their product delivery through the website.

- **Multi-User Access**

The system can allow multiple staff members to access the admin panel with different roles and permissions.
